Deep Dive into Oil Classifications and Equivalencies

To appreciate the utility of the Mobil Oil Equivalent Chart Shell, it's important to understand key classifications and how they relate.

Viscosity Grades (SAE)

Viscosity is a measure of an oil's resistance to flow, critical for ensuring proper lubrication across temperature ranges.

- Multi-grade oils:** e.g., 5W-30, designed to perform in a wide temperature range.
- Single-grade oils:** e.g., 30, primarily for high-temperature conditions.

The chart cross-references SAE grades with API service categories, enabling users to identify synthetic or mineral oils that match desired performance.

Performance Standards (API and ACEA)

- API Ratings:** Indicate the oil's performance level for gasoline (S categories) and diesel engines (C categories). For example, API SN (gasoline) or CJ-4 (diesel).
- ACEA Ratings:** European standards considering engine and emissions compatibility, e.g., ACEA A3/B4. The chart aligns Shell's products with these standards, helping users to find functionally equivalent oils.

Synthetic vs. Mineral Oils

Synthetic oils often offer superior thermal stability and longer service intervals. The chart clarifies how Shell's synthetic offerings

compare to mineral oils of similar viscosity and performance. Additives and Special Features Some oils contain specific additive packages for anti-wear, detergency, or fuel economy. The chart indicates equivalencies in additive performance, which is vital for specialized machinery or environmental compliance.
